# The Busy Beaver Problem

“Consider, for a fixed positive integer  $n$ , the class  $K_n$  of all the  $n$ -card [state] binary turing machines ... Let  $M$  be a Turing machine in this class  $K_n$ . Start  $M$ , with its card 1, on an all-0 tape. If  $M$  stops after a while, then  $M$  is termed a *valid entry* in the *BB- $n$*  contest ... and its score  $\sigma(M)$  is the number of 1's remaining on the tape at the time it stops ... [the set of  $\sigma$ -values] has a (unique) largest element which we denote by  $\Sigma(n)$  ... It is practically trivial that this function  $\Sigma(n)$  is not general recursive ... [but] it may be possible to determine the value of  $\Sigma(n)$  for particular values of  $n$ .”

-Lin & Rado “Computer Studies of Turing Machine Problems” Journal of the Association for Computing Machinery, Vol. 12, No. 2 (April, 1964), pp. 196-212

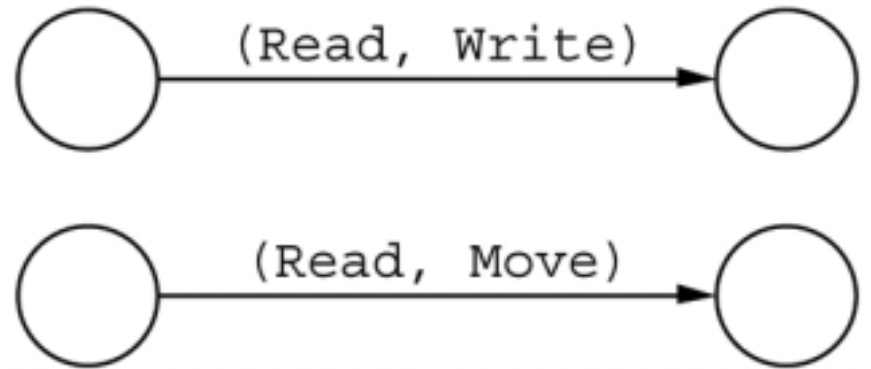

# Variants of the Problem

- quadruple vs. quintuple
- standard position vs. arbitrary format output
- implicit vs. explicit halt machine

# Turing Machine Formulations

quintuple formulation

quadruple formulation

# Turing Machine Formulations

explicit halt

implicit halt

# Turing Machine Formulations

B(5)-11

# Previous Work on Quadruple

- $R(n)$  - quadruple, explicit, no restriction
  - [nobody?]
- $O(n)$  - quadruple, implicit, no restriction
  - Oberschelp et al.
- $P(n)$  - quadruple, explicit, standard
  - Pereira et al.
- $B(n)$  - quadruple, implicit, standard
  - Boolos and Jeffrey

# Known Results

n	R(n)	O(n)	P(n)	B(n)
1	<b>1</b>	1	1	1
2	<b><math>\geq 2</math></b>	2	2	2
3	<b><math>\geq 4</math></b>	3	4	3
4	<b><math>\geq 8</math></b>	8	<b><math>\geq 7</math></b>	<b><math>\geq 5</math></b>
5	<b><math>\geq 16</math></b>	15	<b><math>\geq 16</math></b>	<b><math>\geq 11</math></b>
6	<b><math>\geq 71</math></b>	<b><math>\geq 70</math></b>	<b><math>\geq 41</math></b>	<b><math>\geq 25</math></b>
7			$\geq 164$	$\geq 164$
8			$\geq 384$	

# About the Quadruple Formulation

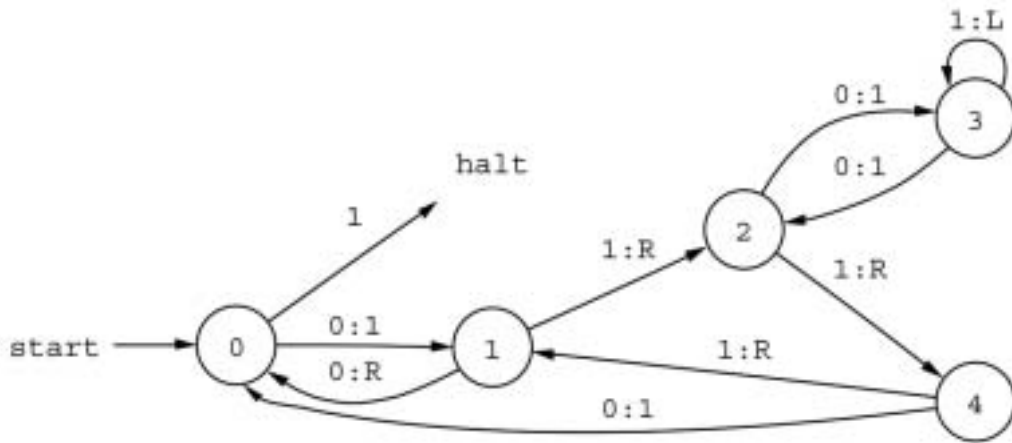

- Turing's World & Greg's challenge
- less-productive than quintuple machines
- greater room for optimisations

# The Search Space

- $|M(n)| = (4n+1)^{2n}$ 
  - 4 possible actions for each of  $n$  next states
  - 1 no-action transition to halt-state
  - $2n$  possible transitions
- for  $B(6) = (4(6)+1)^{2(6)} = 5.96 \times 10^{16}$  machines
- not hopeless!

# Inefficiency: Isomorphisms

B(5)-11

B(5)-11-isomorph

# Inefficiency: Unused Transitions

B(4)-5-u1

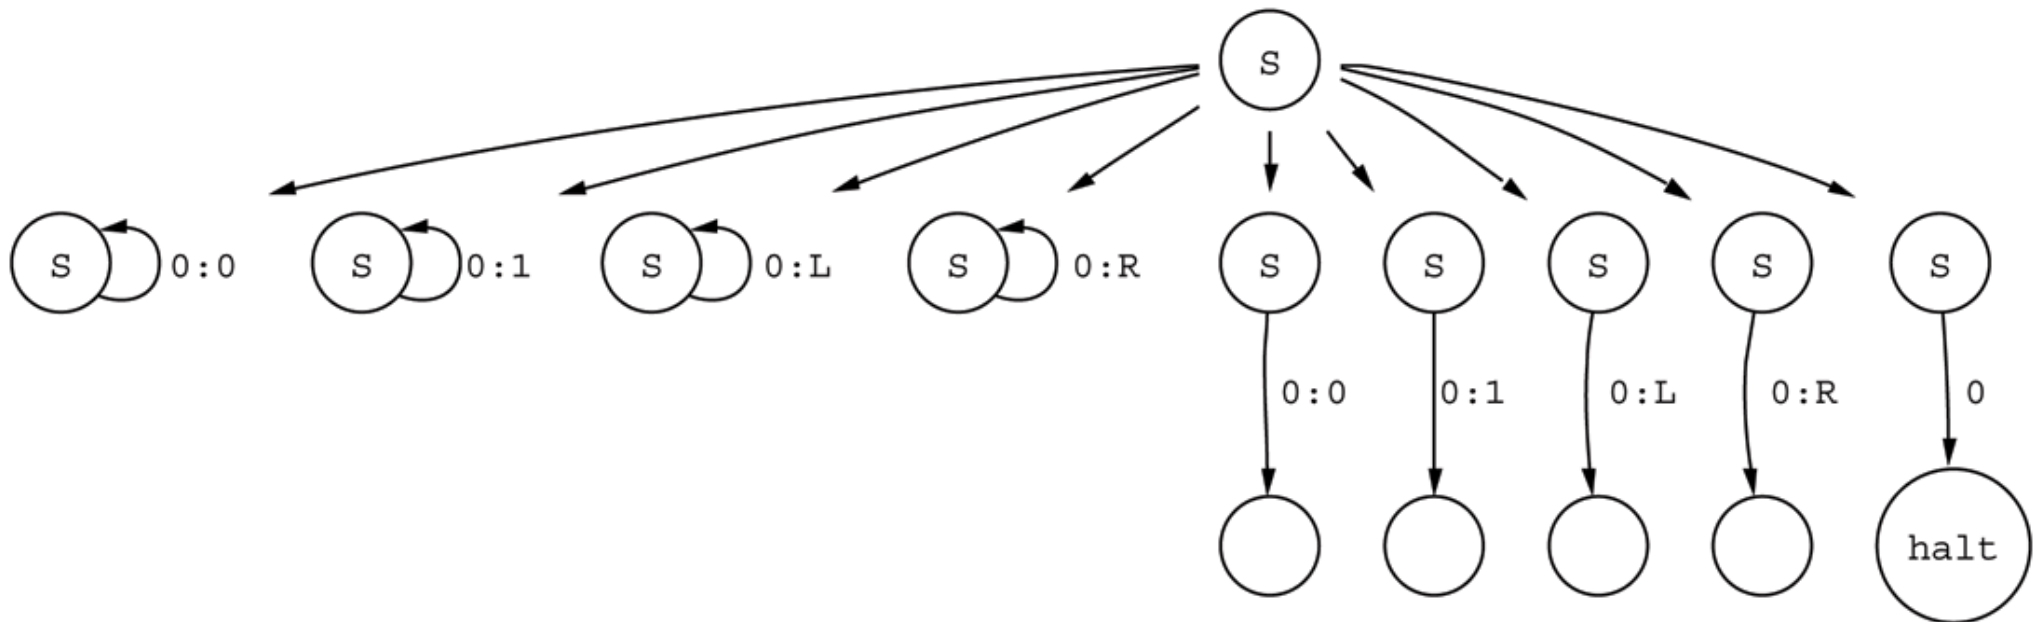

B(4)-5-u2

# Solution: Tree Normalisation

# Solution: Tree Normalisation

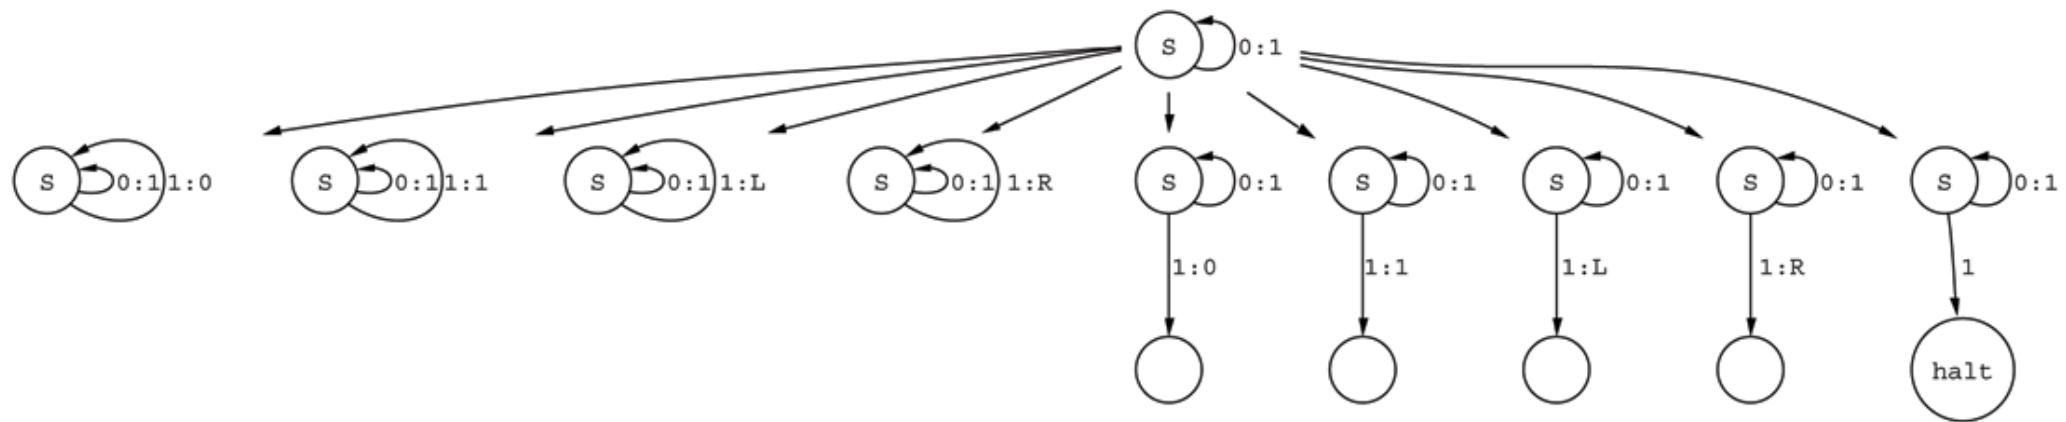

# Solution: Tree Normalisation

~~non-halter~~

# Solution: Tree Normalisation

# Solution: Tree Normalisation

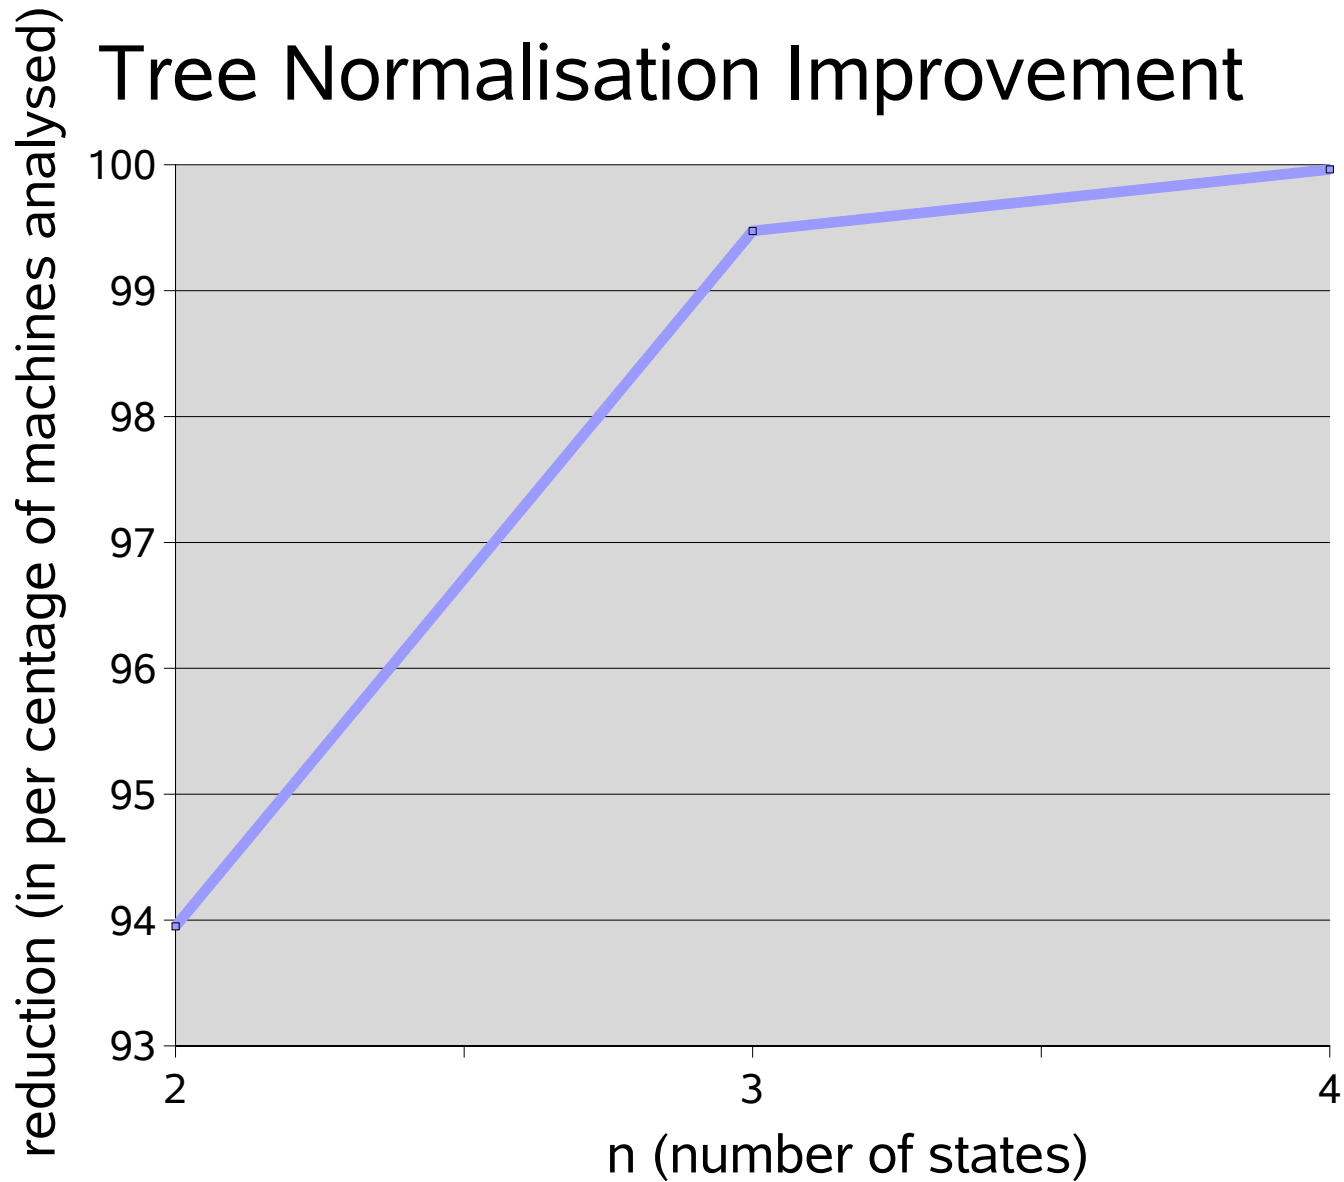

~~non-halter~~

# Features of Tree Normalisation

- complete & optimal search
- no loss of absolute numbers
- great speed-up over pure brute-force

# Improvement from Normalisation

# Inefficiency: Empty Tape Machine

- machine reaches an empty tape after 1 or more shifts
- any machine that does not write 1 as its first action is such a machine

# (Partial) Solution: Force First Write

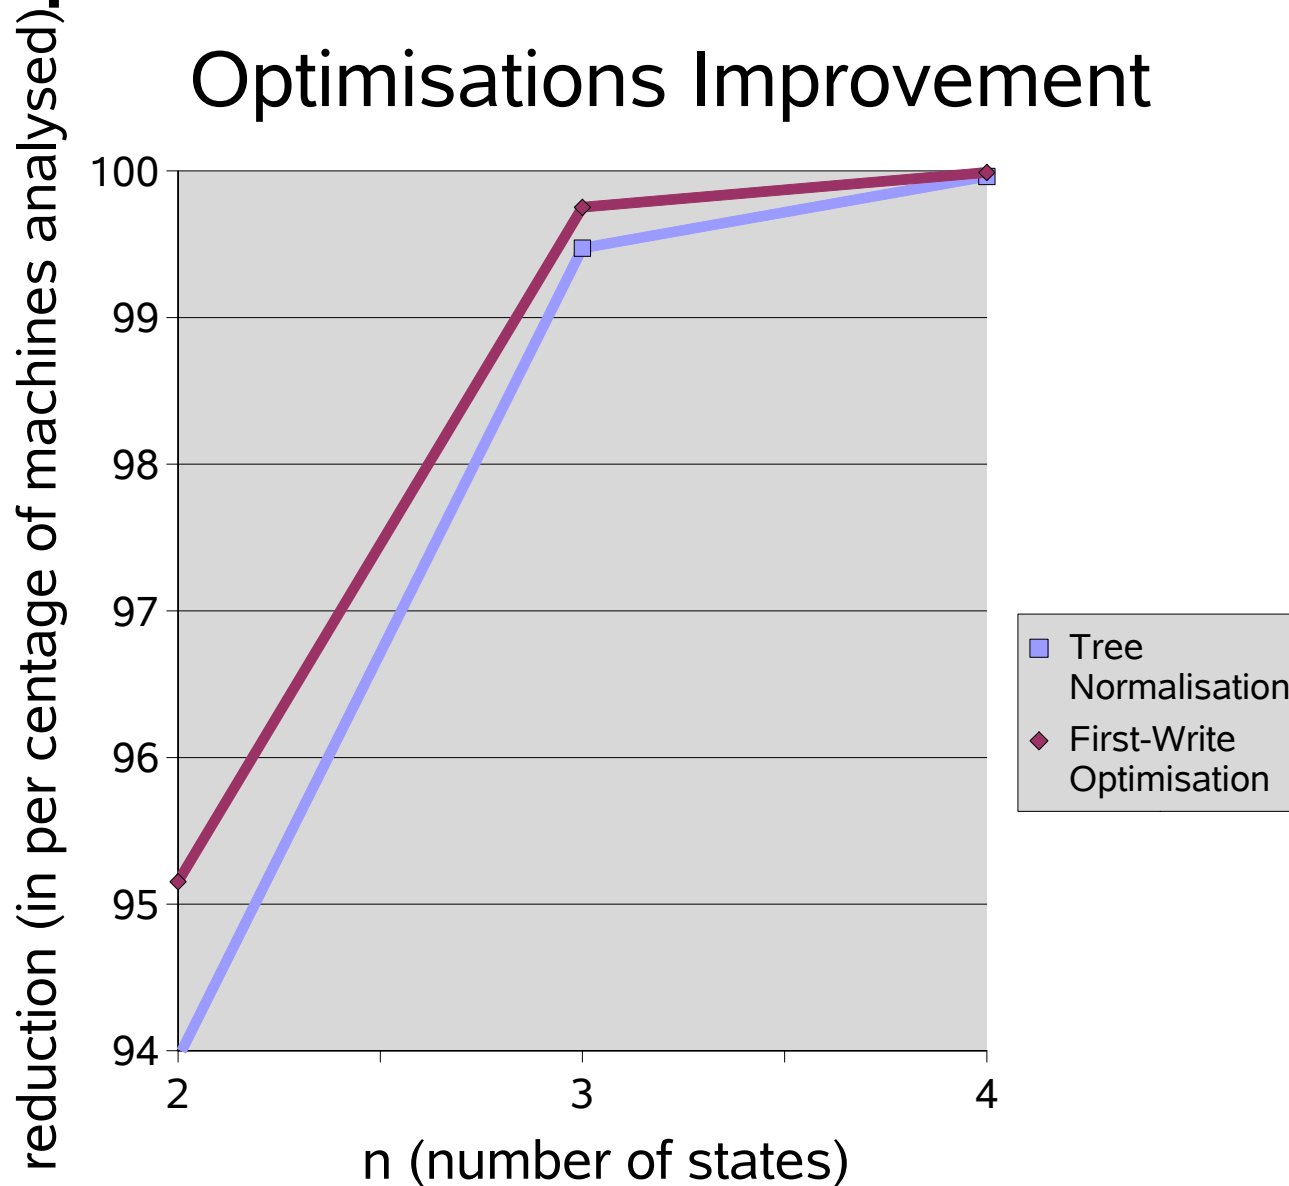

~~non-halter~~

~~first write not 1~~

# (Partial) Solution: Force First Write

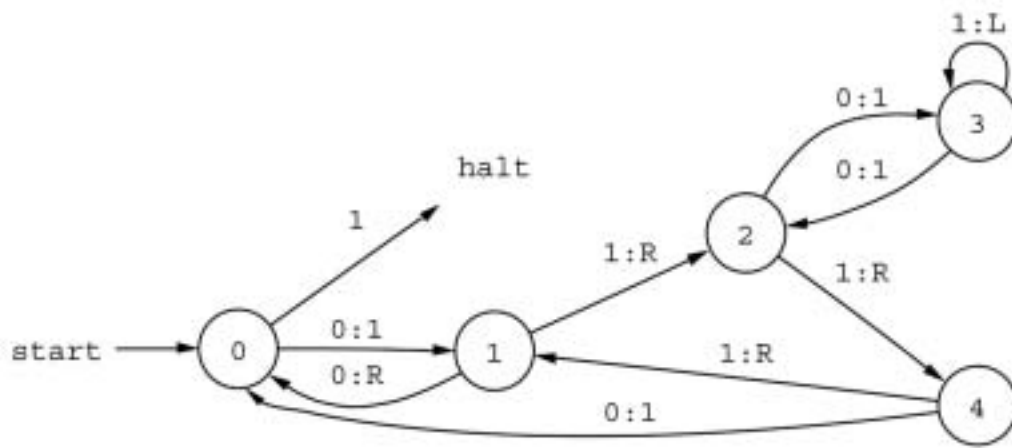

# Improvement from First Write

# Inefficiency: Nonproductive Transitions

# Inefficiency: Mirror Machines

B(5)-11

B(5)-11-mirror

# Solution: Force First Move

- ~~non-halter~~
- ~~first move not R~~
- ~~first write not 1~~
- ~~s:s transition~~
- ~~s:s'-s':s transition~~

# Solution: Force First Move

# Solution: Force First Move

- ~~non-halter~~
- ~~first move not R~~
- ~~first write not 1~~
- ~~s:s transition~~
- ~~s:s'-s:s transition~~

# Solution: Force First Move

~~low-productivity~~

# Solution: Force First Move

# Improvement from First Move

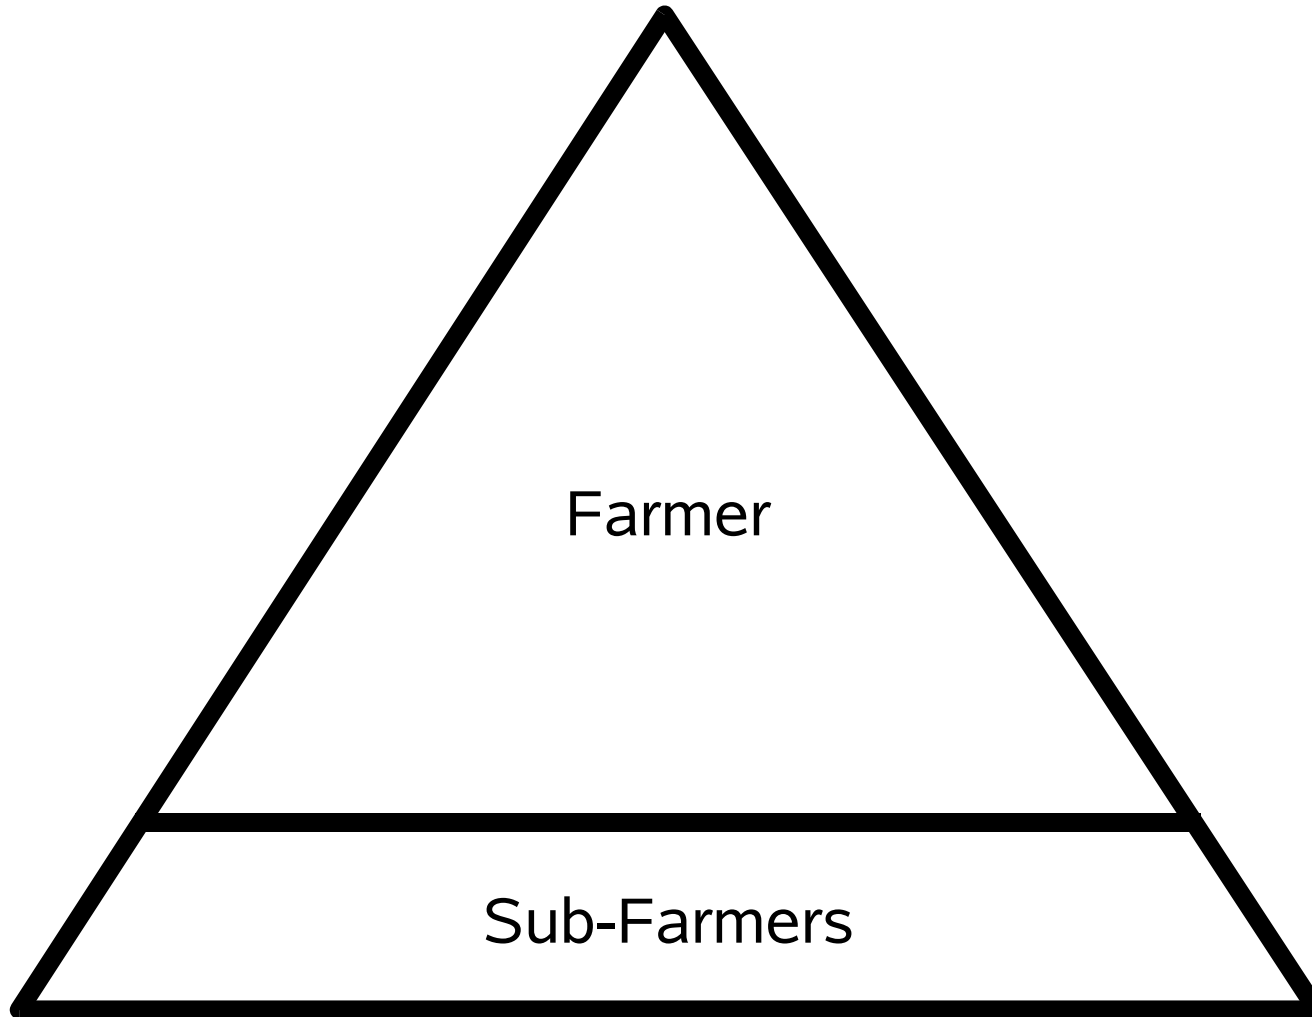

# Distributed Computing

- still a lot of work to do (particularly for  $n > 6$ )
- C/C++ farmer / worker model
- SALSA actor / theatre model

# C++ Farmer / Worker Distribution

# SALSA Actor Distribution

# Features of Farmer / Worker

- centralised view of problem
- dynamic search-space sub-division
- compatible with optimisations
- representation and partial machines

# Future of the Problem

- ultimately will always remain non-computable
- always able to get candidates
- reduction to halting problem and limits of human analysis
- Kyle's prediction: nobody will get past  $B(8)$  for a *very* long time

# RPI B(6) Champion\*

B(6)-25

\* This machine is also the world champion (and probably the theoretical B(6) champion).

# We Beat the Portuguese!

P(6)-41

# We Have Records for $O(6)$ & $R(6)$ !

R(6)-71
